## S.H.A.C. Waffle Ultra - User Manual

Object Oriented Design - Miniproject

Erik Fudge - Client/Server Communication

Lucas Gaspar - Encryption & Diagram Author

Jack Griffin - GUI & Manual Author

**S.H.A.C. Waffle Games** is our final project; a collection of 3 games that users can play either solo or against other users. It allows users to communicate with one another through rooms they create, whether it be private or public. It retains many of the same features of our previous S.H.A.C. projects, with the main feature being the aforementioned games.

### How to run the program

Within ChatClient.java, at line 96 you can either set the SERVER\_ADDRESS String to "localhost" to run the program all on one device, or have all users and the server set the String to said server's IP address. After doing so, the file needs to be saved. From there, using the terminal, the server will execute: "java CServer", and all clients should run: "java CClient" after the server is up and running. Below are screenshots of what the terminal should look like:

```
PS C:\Users\acook\Downloads\Miniproject1> java CServer  
Server started on port 3500. Waiting for clients...
```

```
PS C:\Users\acook\Downloads\Miniproject1> java CClient
```

### **Description of the server**

The server must be up and running first, followed by the client(s). The server runs in the background as long as the terminal is running, and its status can be seen by clients when they're in the chat application.

### **Description of the clients**

The clients, upon logging in, are able to chat with other connected users through created rooms within the Main Chat Window.

### **The Games**

*Many of these features can be found in the demo video*

The three games are SHACUNO, SHACBATTLESHIP, & SHAQWWTBAM (Who Wants to be a Millionaire). Buttons at the top of the Main Chat Window allow the users to play said games.

Additionally, players are able to invite one another into these games.
